

# Backings

Backings make placement of **objects** in the **Standard view** more convenient for perception. Backings are for informational purposes only, they are not involved in monitoring processes.

**i** Backings do not have IDs. Backing change history can be seen in the **change log** of the parent object.

**i** A backing name, in contrast to an object name, can be empty.

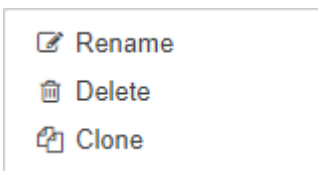

## Backing creation

In order to create a new backing it is sufficient to:

- click the button  in the **Main toolbar** (a backing name will be required);
- select the field  in the **context menu** (a new backing with an empty name will be created immediately).

## Backing context menu

With the right click on a backing the backing context menu appears. Using the menu, a backing can be renamed, deleted or cloned.

 When a backing is cloned, the elements on the backing are not cloned.

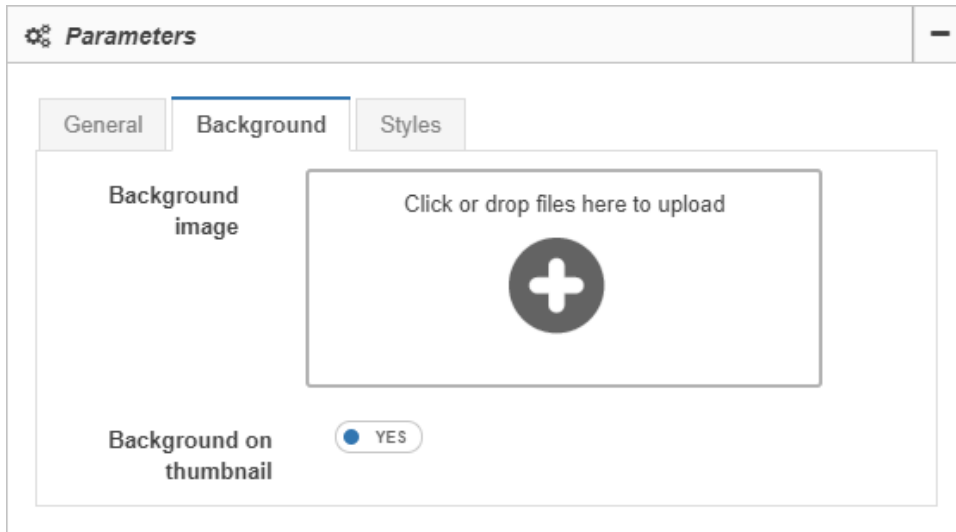

## Backing settings

**Info modal** is available for backings. There are following tabs in the window:

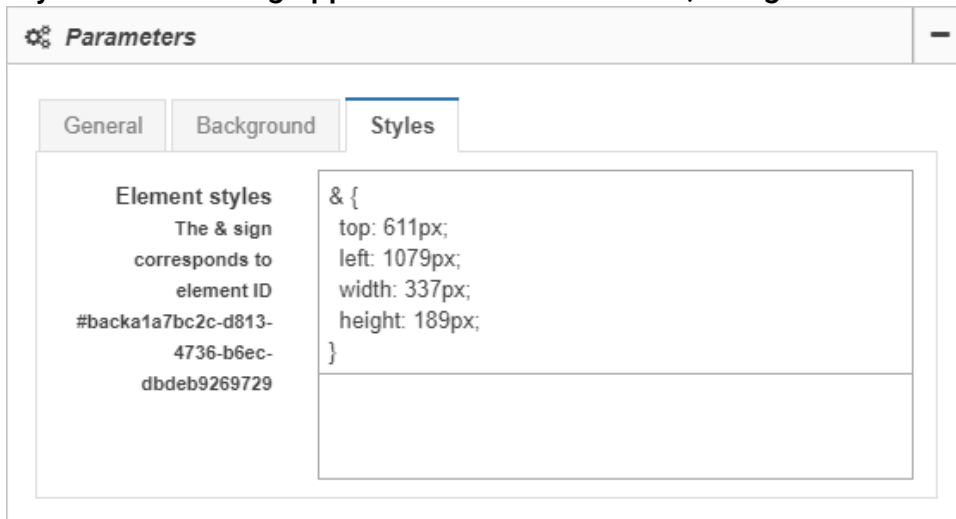

- **General**. The backing name can be set here. The name is displayed at the bottom left corner of the backing.

- **Background.** The background image can be set and displaying of the image can be turned on/off here.

- **Styles.** The backing appearance can be set here, using CSS.

**i** With moving a backing around the screen or stretching/compressing the backing, the values of the properties responsible for backing size and location will be automatically recalculated.
